## **More Exercises: Lists**

Problems for exercise and homework for the "C# Fundamentals" course @ SoftUni You can check your solutions in Judge

# 1. Messaging

You will be given a list of numbers and a string. For each element of the list you must calculate the sum of its digits and take the element, corresponding to that index from the text. If the index is greater than the length of the text, start counting from the beginning (so that you always have a valid index). After you get that element from the text, you must remove the character you have taken from it (so for the next index the text will be with one characterless).

## **Example**

Input	Output		
9992 562 8933	hey		
This is some message for you			
11 2 32 43 331 522 441 2241 711 1821	dangerous!		
69da343n44ge96rous311!			

#### 2. Car Race

Write a program to calculate the winner of a car race. You will receive an array of numbers. Each element of the array represents the time needed to pass through that step (the index). There are going to be two cars. One of them starts from the left side and the other one starts from the right side. The middle index of the array is the finish line. The number of elements in the array will always be odd. Calculate the total time for each racer to reach the finish, which is the middle of the array, and print the winner with his total time (the racer with less time). If you have a zero in the array, you have to reduce the time of the racer that reached it by 20% (from his current time).

Print the result in the following format "The winner is {left/right} with total time: {total time}".

# **Example**

z.a.i.pic			
Input	Output		
29 13 9 0 13 0 21 0 14 82 12	The winner is left with total time: 53.8		
Comment			
The time of the left racer is $(29 + 13 + 9) * 0.8$ (because of the zero) + 13 = 53.8			
The time of the right racer is $(82 + 12 + 14) * 0.8 + 21 = 107.4$			
The winner is the left racer, so we print it			
Input	Output		
26 46 31 43 1 23 44	The winner is right with total time: 68		

# 3. Take/Skip Rope

Write a program, which reads a string and skips through it, extracting a hidden message. The algorithm you have to implement is as follows:

Let's take the string "skipTest\_String044170" as an example.

Take every digit from the string and store it somewhere. After that, remove all the digits from the string. After this operation, you should have two lists of items: the numbers list and the non-numbers list:

- Numbers list: [0, 4, 4, 1, 7, 0]
- Non-numbers: [s, k, i, p, T, e, s, t, \_, S, t, r, i, n, g]

After that, take every digit in the numbers list and split it up into a take list and a skip list, depending on whether the digit is in an **even** or an **odd** index:

- Numbers list: [0, 4, 4, 1, 7, 0]
- Take list: [0, 4, 7]
- Skip list: [4, 1, 0]

Afterward, iterate over both lists and skip {skipCount} characters from the non-numbers list, then take {takeCount} characters and store it in a result string. Note that the skipped characters are summed up as they go. The process would look like this on the aforementioned non-numbers list:

- 1. Take 0 characters → Taken: "", skip 4 characters (total 0) → Skipped: "skipTest\_String"→ Result: ""
- 2. Take 4 characters → Taken: "Test", skip 1 character (total 4) → Skipped: "skip" → Result: "Test"
- 3. Take 7 characters → Taken: "String", skip 0 characters (total 9) → Skipped: "" → Result: "TestString"

After that, just print the **result string** on the console.

## Input

First line: The encrypted message as a string

## Output

First line: The decrypted message as a string

#### Constraints

- The count of digits in the input string will always be even.
- The encrypted message will contain any printable ASCII character.

## **Examples**

Input	Output
T2exs15ti23ng1_3cT1h3e0_Roppe	TestingTheRope
O{1ne1T2021wf312o13Th111xreve!!@!	OneTwoThree!!!
this forbidden mess of an age rating 0127504740	hidden message

# 4. \*Mixed Up Lists

Write a program that mixes up two lists by some rules. You will receive two lines of input, each one being a list of numbers. The mixing rules are:

- Start from the **beginning of the first** list and the **ending of the second.**
- Add element from the first and element from the second.
- In the end, there will always be a list, in which there are 2 elements are remaining.
- These elements will be the range of the elements you need to print.
- Loop through the result list and take only the elements that fulfill the condition.
- Print the elements ordered in ascending order and separated by a space.

## **Example**

Input	Output		
1 5 23 64 2 3 34 <mark>54 12</mark>	23 23 31 34 43 51		
43 23 12 31 54 51 92			
Comment			
After looping through the two of the arrays we get:			
1 92 5 51 23 54 64 31 2 12 3 23 34 43			
The constraints are $\frac{54}{4}$ and $\frac{12}{2}$ (so we take only the numbers between them): 51 23 31 23 34 43.			
We print the result sorted.			
Input	Output		
87 30 65 23 39	46 65 72 78		
41 85 41 72 46 78 10			

### 5. \*Drum Set

Gabsy is Orgolt's Final Revenge charming drummer. She has a drum set but the different drums have different origins – some she bought, some are gifts, so they are all of different quality. Every day she practices on each of them, so she does damage and reduces the drum's quality. Sometimes a drum breaks, so she needs to buy a new one. Help her keep her drum set organized.

You will receive Gabsy's savings, the money she can spend on new drums. Next, you will receive a sequence of integers, which represents the initial quality of each drum in Gabsy's drum set.

Until you receive the command "Hit it again, Gabsy!", you will be receiving an integer: the hit power Gabsy applies on each drum while practicing. When the power is applied, you should decrease the value of the drum's quality with the current power.

When a certain drum reaches 0 quality, it breaks. Then Gabsy should buy a replacement. She needs to buy the same model. Therefore, its quality will be the same as the initial quality of the broken drum. The price is calculated by the formula: {initialQuality} \* 3. Gabsy will always replace her broken drums until the moment she can no longer afford them. If she doesn't have enough money for a replacement, the broken drum is removed from the drum set.

When you receive the command "Hit it again, Gabsy!", the program ends and you should print the current state of the drum set. On the second line you should print the remaining money in Gabsy's savings account.

### Input

- On the **first line**, you will receive the **savings** a floating-point number.
- On the second line, you will receive the drum set: a sequence of integers, separated by spaces.

Until you receive the command "Hit it again, Gabsy!", you will be receiving integers – the hit power Gabsy applies on each drum.

## **Output**

- On the first line, you should print **each drum** in the drum set, **separated** by **space**.
- Then you must print the money that is left on the second line in the format "Gabsy has {money left}lv.", formatted with two digits after the decimal point.

#### **Constraints**

- The savings a floating-point number in the range [0.00...10000.00].
- The quality of each drum in the drum set an integer in the range [1...1000].
- The hit power will be in the range [0...1000].
- Allowed working time / memory: 100ms / 16MB.

## **Examples**

Input	Output	Comment
1000.00	7 14 23	DrumSet – 58 65 33.
58 65 33	Gabsy has 901.00lv.	Day 1: hit power applied = 11 => 47 54 22;
11		901.001v. Day 2: hit power applied = 12 => 35 4
12		Day 3: hit power applied = 18 => 17 24 -8;
18		The third drum breaks. But Gabsy has enough
10		savings, so she replaces it => 17 24 33;
Hit it again, Gabsy!		Day 4: hit power applied = 10 => 7 14 23;
		We print the current state of the drum set and what's left in Gabsy's bank account.
154.00	27 2 4 7	
55 111 3 5 8 50	Gabsy has 10.00lv.	
2		
50		
8		
23		
1		
Hit it again, Gabsy!
